

Generative AI and Creative Expression

Chunru Qiu 40283505

Assignment_1

Generative AI is a type of artificial intelligence that can create new content such as images, text, music, video, and code based on patterns learned from large amounts of data. My current understanding is that generative AI does not simply copy an existing work. Instead, a model uses what it has learned to generate a new result based on an instruction, such as a text prompt. Through my experience with this assignment, I learned that the creative process still depends heavily on the human. For example, when using Stable Diffusion with the Diffusers library, I had to carefully describe the subject, environment, lighting, style, and surreal elements that I wanted to see. Changing a few words in the prompt could significantly change the generated image.

Generative AI has many interesting applications in creative fields. Artists can use it to explore visual ideas, experiment with different styles, and quickly produce variations of a concept. Designers can use it for concept development, advertising, fashion, illustration, and visual storytelling. It can also be used in animation, music, film, interactive installations, and game development. I think its most important role is not necessarily replacing artists, but giving them a new medium for experimentation and collaboration.

One work of generative AI-driven art that inspires me is **Refik Anadol's ***Unsupervised*. I find this work interesting because it uses machine learning to transform data into constantly changing visual forms. Instead of AI simply being used to create one finished image, the technology becomes part of the artwork itself. This makes me think differently about the relationship between data, machines, and human creativity.

My own surrealism experiment showed me that generative AI can also produce unexpected results from relatively simple ideas. This makes the technology exciting to me because it allows artists to explore possibilities that they may not have imagined before.
